## Introduction

This section presents the events and visibility aspects of the PATRIUS library. First of all, it is necessary to manage the event detection during the propagation, to that purpose, a smart mechanism has been developed in the math package and repeated in Patrius when it comes to propagate with an AbstractPropagator. In Patrius, it is possible to register during the propagation the detected events. A new conception has been developed on this basis in order to create a list of CodedEvent (code + comment + date) during the propagation as well as a list of Phenomenon. Then, the user can perform a post processing on the generated events list and phenomena list thanks to several filters.
